

# A Smart Way to Better Bed Bug Management

**NATTARO SCOUT™**  
Monitoring System with Pheromone Lure

# Your provider of solutions for bed bug control

*Do you have customers who have problems with bed bugs?  
Do you want to detect or monitor bed bugs in order to identify the  
problem early? Then Nattaro Labs is the ideal product company  
for you. We are bed bug experts, and have unique patented  
Swedish inventions that prevent and detect bed bugs.*

## Proven effect

Nattaro Scout™ is a bed bug monitoring system with proven effect. Thanks to its design the monitor is easy to fit on the floor, under the bed frame or inside the bed between the mattresses. The unique lure consists of synthetic pheromones and mimics a normal sized bed bug harbourage (aggregation). The construction is a pit fall trap, where the bed bugs can climb in but not out. When used as a continuous monitoring, the lure should be changed on a regular basis.

- Immediate release, re-charge every two weeks
- Captures bed bugs of all stages
- For early detection and quality control of treatments

# Working with the bed bugs biology, not against it

Research shows that nine out of ten bed bug infestations starts in our beds, and since the growth rate is exponential it is important to discover an infestation early. The Nattaro Scout device captures all stages of bed bugs, making it a useful system for professional pest control technicians. Thanks to its design, the product is easy to work with and fits well where it is needed, whether under the bed, on the floor or between mattresses. Use Nattaro Scout to identify an infestation before treatment and as a control to verify the effect of your treatment. The hit rate is 90% or more during the first six days.

Use Nattaro Scout when you suspect an infestation but cannot find any bed bugs. Use post-treatment to verify that the result has been successful. The lure is especially attractive to female bed bugs.

- Easy to place in or under the bed or on the floor
- An effective and discrete device in any environment
- A perfect complement to other pest control routines

# Bed bug specialists

The bed bug problem continues to grow throughout the world. Here at Nattaro Labs, we specialise in bed bugs and in developing products to effectively prevent and combat this challenge.

## Globally unique research

Our business is based on unique research in Chemical Ecology initiated at Lund University, southern Sweden. In our own research laboratory, we are continuously working to learn more and to develop our offering. Nattaro Scout, the monitoring system with bed bug pheromones, is a unique invention made in Sweden.

## Expert help

Nattaro Labs work with pest control professionals all over the world, leading researchers, the accommodation industry and others to prevent, detect and control bed bug infestations. In addition to our products we also offer consultancy, education and training programs as well as other knowledge enhancing activities.

How can we help you?
